

1

In preparing to lay your **Sir Walter Buffalo** it is advisable to have at least 100mm of well-worked soil. This can be achieved by rotary hoeing the existing soil if suitable or if there is minimal or poor soil, additional top soil is required. Remove all stones, clods and other debris.

2

Rake the entire area to ensure there is a smooth, even surface and allow about 25mm below paths and driveways for the thickness of the turf.

3

You are now ready to order your **Sir Walter Buffalo**. Using a tape, measure the area and calculate it in square metres. Organise the delivery for the day you intend to lay the turf, as prompt installation is important for a good start to your lawn.

4

Lilydale Instant Lawn provides you with a Low Water Establishment Pack (**LWEP**), which contains Organic Water Saver, Water Crystals, Seasol & Fertilizer. **LWEP** will be helpful in the establishment of your newly laid **Lilydale Instant Lawn**. You will need to apply the Organic Water Saver, Water Crystals & Fertilizer to the soil prior to laying your turf.

5

Begin laying your turf along a straight edge, such as a driveway or path, furthest from the stack of turf.

6

When laying **Sir Walter Buffalo**, place the turf sections on the ground, next to each other in a brick-work pattern. Do not push them up too hard as this can leave the root system without ground contact. This will cause the turf to dry out quickly and you will use more turf than your area needs.

7

The turf can be trimmed with a sharp knife to conform with paths and garden edges etc.

8

It is vital that once you lay your **Sir Walter Buffalo** you top dress it with white washed sand. (approximately 1m³ to every 100 m² of turf.)

You may also roll your turf after top dressing to achieve maximum soil contact.

9

It is essential that watering of **Sir Walter Buffalo** commences immediately upon installation. A thorough soaking of the turf is required. It is highly recommended you use the Seasol provided to water in your turf. For larger installations, watering should commence as sections are completed. It is vital that the turf is kept moist until root growth is established. To establish **Sir Walter Buffalo** especially in hot conditions, it is best to water up to four times per day. Once the roots have taken hold, watering can be eased off.
