

# Winter Lawn Care

**Although not the most comfortable time of year to be in the garden due to the frosty cold, Winter is still an opportunity for us gardeners to maintain our lawn.**

Mowing regularity will reduce during Winter, so it's great to reallocate that saved time to get on top of those Winter weeds, perhaps give your lawn a colour and then retreat into the warmth by the open fire for a rest until Spring.

Here's some handy jobs to be done for your lawn this winter:

## **1. Pre-Emergent Herbicide and Fertiliser Application**

Lawn Solutions Oxafert Herbicide & Fertiliser is a pre-emergent herbicide for control of many annual grasses and broad-leaf weeds in warm season turf. The idea of using a pre-emergent herbicide is to target weed seeds before they take hold by forming a barrier at soil level that affects the germination of any new seedlings. Spreading [Oxafert](#) out now will give your lawn protection for up to 3 months from winter weeds.

## **2. ColourGuard**

ColourGuard Plus is a natural organic grass colourant with liquid nitrogen which strengthens and protects grass under extreme conditions and instantly restores the colour by providing natural green pigment back into the grass leaf. [ColourGuard Plus](#) applied now will improve your lawns colour and help to protect the leaf from the cold and frost.

## **3. Weed Control**

Everyday Winter weeds can be a real irritation and negate all the hard work you put into getting your lawn looking superb during the warmer months. The best time to treat Winter weeds in your lawn is during Winter. By doing so, you have more chance of getting them before germination, which will stop them from dropping their seeds back into the soil and coming back again next season. For more information on specific weed control visit our [weed control blog](#).
